Middle Age Abysia: Blood and Fire

Abysia one-page command brief

Middle Age Abysia converts heat, heavy infantry, strong priests, and a capital Blood-mage queue into a compact but demanding war machine. Ordinary forts supply Humanbred screens, four weapon profiles of Abysian Infantry, Salamanders, assassins, animal handlers, Warlords, and two grades of Fire priest. The capital adds Lava Warriors and three Blood-capable commanders, including fixed S2 B3 Warlocks.

The reliable core is straightforward:

- Humanbred cost fewer resources and move faster than the armoured Abysian line, so they can supply bodies where protection is not the only requirement;
- Abysian Infantry provide fire-resistant heavy troops with battleaxe, flail, shielded axe, and shielded morningstar profiles;
- Salamanders add large heat effects and fire attacks, but they are animals, undisciplined, and expensive in gold per body;
- Anathemant Salamanders provide repeatable F2 H2, while Anathemant Dragons provide fixed F3 E1 H3;
- Warlock Apprentices, Demonbred, and Warlocks put Blood access in the capital commander queue;
- the two capital sites generate five Fire gems each month and gate every capital-only recruit;
- national magic spans Fire battle support, Blood crossbreeding, two summons, and a hostile-province ritual;
- repeatable recruits have no fixed Air, Water, Death, Nature, or Glamour access.

Abysia's roster is narrow enough to understand and expensive enough to punish an unfocused plan. Heavy infantry consume resources, Warlocks consume gold, Demonbred consume the entire four-point capital commander allowance shown on their card, and Salamanders consume gold that could have funded another mage or fort. The first question each month is not which strong object exists. It is which bottleneck the next purchase removes.

Abysia evidence and ruleset

The scope is unmodded MA Abysia on the Book I 6.36 live baseline. The revision-2 official manual controls the player-facing national rules, recruitment locations, displayed paths, costs, national spells, rituals, and artifact description. Object identifiers, site fields, nation restrictions, hero records, and expanded random slots are cross-checked against the pinned 6.35 Inspector export at commit `cfac4311bc0b58053b8dead7bffb036ba9bd5dc`.

The official 6.01 announcement says only that Abysia's wall defenders were tweaked. It does not print a new defender count, composition, or formula, so none is invented here. The later 6.27 reference to EA Abysia's AI is not applied to the Middle Age nation. A current unit card, spell card, or battle remains authoritative where the manual and the older structured snapshot expose different levels of detail.

Abysia conversion chain

- heat preference and fire-resistant bodies
- > Humanbred screens, armoured infantry, and early commanders
- > forts, laboratories, temples, and protected recruitment queues
- > Fire priests plus capital Astral-Blood mages
- > Fire research, blood hunting, and national rituals
- > target-specific infantry, heat, assassination, and mage packages
- > protected Blood economy, sieges, and Throne operations

The chain commonly breaks at three points. Too much armour can delay infrastructure because resources do not pay gold costs. Too many capital mages can leave Lava Warriors and field leadership underproduced. A Blood plan can also consume commanders and population without first building safe hunting provinces, patrollers, laboratories, and a reason to spend the slaves.

Abysian national rules that shape the plan

Rule or asset	Operational consequence
Heat preference +3	The roster is designed around very hot territory; scales and foreign provinces must be evaluated from Abysia's preference, not a generic human baseline.
Heat limit +2 and Death limit +1	Pretender-scale choices have nation-specific limits. This does not make every extreme setting economically correct.
Radiated heat and Fire Resistance	Most Abysian bodies carry Heat 3 and Fire Resistance 25. Humanbred instead have Fire Resistance 15 and no printed Heat ability.
Modified Growth and Death effects	Growth and Death have half the standard effect on income and population growth and no effect on supplies. Population still dies slowly in Abysian provinces with Death scales.
Fort protection from heat deaths	Forts reduce heat-scale deaths by two steps. This is a population rule, not a claim that forts erase every economic consequence of temperature.
Cave-fort bonus	The manual grants extra gold and resources in cave forts, but prints no amount. Cave provinces are attractive, while the missing multiplier stays unquantified.
Powerful priests and blood sacrifice	H2 and H3 priests support sacreds, preaching, and sacrifice. Blood sacrifice still spends slaves and priest turns.
Bless points +1	Abysia receives one extra bless point, but most of its ordinary infantry is mundane. The main recruitable sacred troop is the capital-only Lava Warrior.
No national missile troops	Ranged pressure must come from magic, summons, independents, or imported options. A heavy line does not itself answer a protected enemy caster.

The Growth and Death exception is easy to overread. It changes several scale effects, yet it does not make population disposable: Death still kills people, Blood hunting raises unrest, and lost population can still reduce later income. The roster's fire resistance also does not make it immune to cold, armour-negating damage, fatigue, morale failure, or magic-resistance attacks.

Abysia capital sites and recruitment queues

Site	Verified fields	Recruitment consequence
The Smouldercone, site 1	Four Fire gems per month; Heat scale capped at 4	Enables Warlock Apprentice, Warlock, and Demonbred

Site	Verified fields	Recruitment consequence
Temple of the All-Consuming Flame, site 121	One Fire gem per month	Enables Lava Warrior

Together the sites produce five Fire gems each month. That income supports Fire operations, not the Blood slaves or Astral pearls implied by the capital mages. Those economies require their own provinces, searches, trades, conversions, or imported access.

The Smouldercone creates the main capital-queue decision. A Warlock Apprentice costs 190 gold and two recruitment points; a Warlock costs 400 gold and two; a Demonbred costs 375 gold and four. The Temple creates a separate capital troop option, but the same capital must still supply ordinary troops, infrastructure, and commanders. A queue should be planned by the capability required next, not by buying the most expensive unit automatically.

Abysia roster by job

Unit or group	Best job	Important limit
Humanbred with spear	Lower-resource screen and longer-weapon body	Morale 9, Protection 9, Fire Resistance 15, and no heat aura make it materially different from an Abysian Infantryman.
Humanbred with axe	Lower-resource damage body behind or beside a holding line	The axe version gives up the spear's length and still has the Humanbred defensive profile.
Battleaxe Abysian Infantry	Heavy two-handed damage	No shield; slow combat speed and encumbrance make contact and fatigue part of the purchase.
Flail Abysian Infantry	Heavy alternative weapon profile	No shield and lower printed Defence than the battleaxe version; use only when the target justifies the weapon.
Shielded axe Abysian Infantry	Protected general line	More resources and encumbrance than the two-handed profiles; its one-handed damage must still defeat the target.
Shielded morningstar Abysian Infantry	Protected line with a different damage profile	The highest resource cost among ordinary infantry variants and no universal answer to armour.
Salamander	Fire attack and Heat 6 pressure	Animal, undisciplined, Morale 9, and 50 gold; needs suitable leadership and a battle where heat or fire matters.
Lava Warrior	Capital-only sacred assault infantry	Thirty gold, 28 resources, Berserker +3, two weapons, and low printed Defence; losses consume a limited capital queue.

The four Abysian Infantry versions are choices, not a progression ladder. Shielded troops improve the defensive profile against many mundane missiles and attacks, while two-handed troops preserve a different weapon and resource trade. Exact performance depends on the enemy weapon, protection, size, formation, fatigue, and terrain; the dossier does not assign a universal winner.

Abysia commander and mage portfolio

Commander	Paths or ability	Main jobs	Recruitment warning
Slayer	Stealth 60, Assassin, Patience +1	Scouting, assassination pressure, and intelligence	Ninety-five gold for no army leadership or magic path; assassination outcomes remain target dependent.
Beast Trainer	Beastmaster 3, Animal Awe +4, Magic Leadership 10	Handling Salamanders and other suitable animals	Inspirational -1 and Leadership 25 mean it is not Abysia's general field commander.
Warlord	Leadership 100, Taskmaster +2, two axes	Main mundane army command	One hundred ten gold and 34 resources compete with another armoured body and infrastructure.
Anathemant Salamander	F2 H2, sacred	Repeatable Fire research, priest work, blood sacrifice, blessing, and battle support	Two recruitment points and 260 gold; it does not reach the F3 E1 national spell by itself.
Anathemant Dragon	F3 E1 H3, sacred	High priest, national spell access, forging, and Fire-Earth support	Four recruitment points and 415 gold; the pinned random slot is not printed on the manual card.
Warlock Apprentice	S1 B2, Adept Cross Breeder +2	Blood research, hunting support, communions, and Infernal Breeding	Capital-only and two recruitment points; it has no Fire path despite being Abysian.
Demonbred	F2 B2 H2, flying, Blood Searcher 1, sacred	Mobile priest, Blood search, Fire-Blood support, and command	Capital-only, four recruitment points, and 375 gold; flying mobility does not prove a safe raid.
Warlock	S2 B3 plus pinned randoms, Adept Cross Breeder +6	Main Astral-Blood mage, crossbreeding, hunting, rituals, and research	Capital-only and 400 gold; every useful random result must be labelled and protected.

The ordinary-fort commander pool and capital pool solve different problems. Warlords move conventional armies. Anathemants provide religion and Fire. The three Smouldercone recruits build Blood and Astral capacity. Treating all eight as interchangeable commanders hides the queue that actually limits each plan.

Reading the Abysian random paths

The pinned path mask 35968 decodes to Fire, Earth, Astral, or Blood. Its four component bits are 128, 1024, 2048, and 32768. The mask appears in both the Warlock and Anathemant Dragon records, but the roll structure differs.

Warlock distribution

Every Warlock begins at S2 B3. The manual then prints one random level. The pinned 6.35 record resolves that display as:

- 1 one guaranteed level chosen equally from Fire, Earth, Astral, or Blood;
- 2 an independent 10% chance of a second level from the same four paths.

For any one named path, the first roll hits 25% of Warlocks. If it misses, the second roll can still add that path with probability $75\% \times 10\% \times 25\%$. The chance of reaching at least one level in a named random path is 26.875%.

Portfolio result	Probability per Warlock
No second random level	90%
Second level matches the first path	2.5%

Portfolio result	Probability per Warlock
Second level is a different path	7.5%
Any one named path appears at least once	26.875%
A chosen named path appears twice	0.625%
At least Fire or Earth appears	52.5%

Three independent Warlocks give about a 60.90% chance of at least one result in a chosen named path. Five give about 79.09%, and ten give about 95.63%. These figures measure a recruitment portfolio. They do not guarantee when the result arrives, that it survives, or that the economy can afford uninterrupted recruitment.

The threshold consequences are asymmetric. A Fire double produces F2 on the Warlock; an Earth double produces E2; an Astral double raises the fixed S2 to S4; and a Blood double raises fixed B3 to B5. A single Astral or Blood result instead produces S3 or B4. These path cards open different spell and forge branches, so the final paths should be recorded immediately.

Anathemant Dragon pinned random

The Anathemant Dragon is fixed F3 E1 H3 in the manual. The pinned structured record adds an independent 10% one-level roll from Fire, Earth, Astral, or Blood. That gives 90% no extra level and 2.5% each for F4, E2, S1, or B1.

This slot is less secure than the Warlock's printed random because the manual page shows no random marker at all. The dossier uses it only as a 6.35 planning possibility. In particular, native F4 ritual access must remain conditional until a current recruitment card confirms the bonus.

Abysia native path boundary

Path	Repeatable access	Boundary
Fire	F2 Anathemant Salamander and Demonbred; F3 Anathemant Dragon; Warlock random	Strong and distributed, although the capital Fire-Blood mage and high priest are expensive.
Earth	Fixed E1 Anathemant Dragon; Warlock random; pinned Dragon random may reach E2	No ordinary repeatable E2 guarantee.
Astral	S1 Apprentice, fixed S2 Warlock, Warlock random	Capital-only; the main Warlock can reach S3 or rarely S4 under the pinned scheme.
Blood	B2 Apprentice and Demonbred, fixed B3 Warlock, Warlock random	Capital-only; hunting, unrest control, slaves, laboratories, and caster turns all need a budget.
Air, Water, Death, Nature, Glamour	No repeatable recruit	Must come from independents, summons, empowerment, transformation, items after another bridge, or the Pretender.

None of the three pinned national heroes supplies Air, Water, Death, Nature, or Glamour. Owning a Death ritual does not create a native Death caster. A plan that needs one of these paths must name the source, timing, cost, search route, and replacement plan.

Abysia national spells and caster access

ID	Spell or ritual	Research and paths	Cost or fatigue	Verified native access
317	Summon Spectral Infantry	Conjuration 2, D1 F1	5 Death gems	No recruit or pinned hero has Death; national ownership is not native castability.
318	Contact Scorpion Man	Conjuration 8, E1 F1	12 Earth gems	Fixed Anathemant Dragon qualifies.
319	Inner Furnace	Enchantment 5, F3	100 fatigue, battlefield-wide	Fixed Anathemant Dragon qualifies; an F2 battle caster may require a separate Fire-boost route.
320	Infernal Breeding	Blood 3, B2	25 blood slaves	Apprentice, Demonbred, and Warlock qualify.
690	Liquid Flames of Rhuax	Evocation 5, F3 E1	20 fatigue, range 30+, area 1	Fixed Anathemant Dragon qualifies.
850	Hellscape	Alteration 6, F4	10 Fire gems, range 5	Pinned F-random Dragon reaches F4 only 2.5%; otherwise another explicit bridge is required.

Inner Furnace is described as strengthening the heat radiated by every Abysian on the battlefield. Its exact radius increase, affected-unit boundary, stacking, and fatigue consequences are not derived from the database effect field. Liquid Flames of Rhuax is an armour-piercing Fire attack and is marked unavailable underwater in the manual.

Infernal Breeding crossbreeds Abysians, humans, and giants with demons, Salamanders, and other beasts. The manual warns that many Hell Spawn suffer afflictions and early aging. Neither the manual nor a spell row supplies a complete current output distribution, so the dossier does not promise a particular creature count or quality beyond the ritual record.

Hellscape is an anonymous hostile-province ritual. Its printed effects are Heat +3, Death +1, population -10%, and unrest +20. The fixed Dragon does not meet F4 without another step; a battlefield Fire boost cannot be carried into a strategic ritual. Researching Alteration 6 for Hellscape should follow confirmed caster access, not precede it on hope.

Abysia national item boundary

O'al Kan's Sceptre, item 97, is a unique Construction 9 artifact requiring F3. The pinned item record grants a national rebate to both EA Abysia 16 and MA Abysia 63. The manual lists Fire Spell Range +50%, Cold Resistance +10, Leadership +100, the spell Flare, and a small-area fatigue effect on strike.

A fixed Anathemant Dragon meets the printed F3 forging path. That does not settle the displayed gem cost after the national rebate, other forge modifiers, artifact availability, and rounding are combined. The live forge screen controls that value. The artifact's late research and uniqueness also mean it is a possible capstone, not an opening solution to leadership or range.

Abysia opening priorities

The opening should secure four systems before adding exotic branches:

- 1 enough field leadership to move the troop profile being purchased;
- 2 a line whose protection, weapon, movement, and gold cost fit the nearby independents;

- 3 laboratories, temples, and forts that can recruit the next mage or priest without stranding the army;
- 4 a capital queue split deliberately among Blood-Astral access, mobile Demonbred, and other national needs.

An exact expansion count is not supplied. Humanbred, shielded infantry, two-handed infantry, Salamanders, and Lava Warriors face different risks against cavalry, missiles, high Defence, armour, cold, poison, and morale pressure. Map generation, scales, bless, commander, formation, and combat rolls change the minimum safe force.

The first additional fort should be judged by gold, resources, caves, neighbours, travel geometry, and commander access together. A cave bonus can improve a fort's value, but the manual gives no number. A rich surface chokepoint may still be more useful than a cave that cannot protect borders or connect armies.

Recruitment packages to evaluate from reports

Humanbred screen

Use Humanbred where lower resource cost, higher map movement, or additional bodies matter more than Abysian protection. Spears can extend the weapon line; axes change the damage profile. Their Morale 9 and lower fire resistance require appropriate leadership and positioning; they are distinct from the Abysian line.

Armoured Abysian line

Choose shielded axe or morningstar versions when the defensive profile answers the observed threat. Choose battleaxe or flail versions when their weapon and lower resource cost justify losing the shield. Keep the line narrow enough for support to reach it and broad enough that slow troops do not leave an exposed flank.

Salamander group

Salamanders offer Fire Flare, a bite, Heat 6, and Heat Power 1. A Beast Trainer provides the relevant animal leadership tools, while a mage or Warlord may supply the rest of the force. The group should be selected against a target that is vulnerable to its damage and fatigue pressure; fire resistance, dispersal, cold, morale, or fast contact can change the value sharply.

Lava Warrior reserve

Lava Warriors concentrate capital resources, sacred status, two attacks, Berserker +3, and Heat Power 1. They are an elite answer only when the bless, commander, and target justify scarce recruitment. Low printed Defence and berserking make extraction and casualty control part of the decision.

Abysia research response tree

Research begins with a battlefield or strategic problem and a recruited caster. Abysia owns several national spells at attractive path thresholds, but it cannot deploy every branch from the same mage pool or gem economy.

Branch A: Fire battlefield breakpoints

Conjuration 3's Phoenix Power lets an F2 battle caster reach a higher Fire threshold. Enchantment 5 then offers Inner Furnace at F3, while Evocation 5 offers Liquid Flames of Rhuax to F3 E1. The fixed Dragon reaches both national spells directly; Salamander priests and Demonbred can use an available battle boost for F3 effects but do not gain the Dragon's Earth path.

This branch is strongest when heat pressure or armour-piercing Fire solves the reported enemy. It is weaker against fire resistance, rapid mage disruption, underwater operations, or a battle where Abysia's own fatigue and formation fail before the Fire package matters.

Branch B: Blood economy and Infernal Breeding

Blood 3 makes Infernal Breeding available to all three capital Blood-mage types. The research is only one part of the cost. The plan also needs hunting provinces, patrollers, laboratories, slave transport, unrest control, and mage turns. Apprentices are cheaper crossbreeders; Warlocks carry stronger Blood and the larger Adept Cross Breeder value; Demonbred add flight, priesthood, and Blood Searcher 1.

No expected return is assigned to the ritual or a hunting province. Population, unrest, scales, hunter skill, patrol strength, random outcomes, and current engine rules determine the result. Record actual slaves, unrest, population loss, and outputs before calling the branch efficient.

Branch C: Astral-Blood Warlocks

Fixed S2 B3 makes every Warlock a useful Astral-Blood platform before randoms. Astral and Blood randoms raise the ceiling, while Fire and Earth randoms add cross-path options. This branch should be chosen after recruiting and labelling the actual portfolio; a research target that needs S3, B4, F1, or E1 is conditional until the relevant Warlock exists.

The capital-only nature of the whole Astral pool creates a strategic risk. One raid, siege, or assassination campaign can threaten research, blood hunting, and high-path casting together. Distributed forts, ordinary priests, protected movement, and reserve mages reduce that concentration.

Branch D: summons and remote pressure

Conjuration 2 lists Summon Spectral Infantry, but its D1 F1 requirement exposes a missing native path. Conjuration 8's Contact Scorpion Man is reachable by the fixed Dragon and costs 12 Earth gems. Alteration 6's Hellscape requires F4 and ten Fire gems, with only conditional native access in the pinned Dragon random.

These rituals should be scheduled from the caster backward. Confirm the path, laboratory, research, gems, province, and opportunity cost first. A national name in the spell list is not a reason to divert research when the legal caster or gem income does not exist.

Abysia battlefield packages

Humanbred screen with Abysian damage

Humanbred occupy space and absorb selected contact while more expensive Abysian Infantry supply the weapon needed against the target. The two groups should not be treated as statistically identical. Leadership, morale, movement, fire resistance, and heat exposure differ, so formation and retreat routes matter.

Shielded line with priest support

Shielded Abysian Infantry form the main protected block while an Anathemant blesses sacred auxiliaries, supports morale and religion, or delivers reachable Fire magic. A Warlord can preserve the priest's script and commander turn for magic. The package still needs an answer to enemies that ignore armour or attack the rear.

Salamander heat cell

A limited Salamander group applies Heat 6 and fire attacks beside fire-resistant national troops. Beast Trainer support keeps the animal role explicit. Inner Furnace may intensify the wider Abysian heat package, but its live area and fatigue interactions remain open; do not assume that adding more heat is harmless or universally effective.

Anathemant Fire battery

F2 Salamander priests provide the repeatable base, while a Dragon supplies F3 E1 and H3. The battery is selected for a specific spell breakpoint and protected by troops and placement. Concentrating expensive priests can solve one battle while exposing research, sacrifice, and preaching elsewhere.

Capital Blood operations cell

Apprentices perform lower-cost Blood and Astral work, Warlocks provide high paths and crossbreeding, and Demonbred provide mobile Fire-Blood priesthood. The cell needs scouts, patrol, laboratories, slave logistics, and a protected route between hunting provinces and casting centres. It should not sit as one undefended capital stack merely because every member was recruited there.

Abysia Pretender families

Family	What it solves	What it must not conceal
Economy and production	Supports gold-heavy mages, resource-heavy infantry, and additional infrastructure	Extra resources do not pay Warlock gold, while extra income does not replace capital recruitment points.
Missing-path bridge	Imports Air, Water, Death, Nature, Glamour, or dependable higher Earth	One god does not create distributed national access, search coverage, boosters, or replacement casters.
Sacred combat design	Improves Lava Warriors and sacred commanders	The bulk Humanbred and Abysian Infantry receive no bless.
Resistance and mobility design	Answers cold, shock, poison, magic resistance, map movement, or another observed gap	A broad defensive bless can crowd out the path or scale needed for the wider state.
Awake expander	Supplies early independent-taking power where the roster cannot meet the map safely	Afflictions, counter chassis, lost scales, and delayed path infrastructure can erase the tempo gained.

Family	What it solves	What it must not conceal
Ritual and forging bridge	Reaches Death-Fire, F4, higher Earth, or late artifact thresholds reliably	Research, gems, laboratory turns, and the Pretender's availability remain real costs.

Abysia already possesses deep Fire, Blood, and Astral. A Pretender often creates more value by supplying a missing system, resistance, mobility, or reliable ritual bridge than by adding an unsupported theoretical endpoint. Each imported path should have a first search target, first forge or ritual job, and a plan if the Pretender is unavailable.

Abysia matchup and failure matrix

Enemy problem	First answer to examine	Avoid
Conventional missiles	Shielded infantry, terrain, spacing, pressure, and magic	Marching unshielded two-handed troops through fire because their armour looks high.
Heavy armour	Battleaxes, morningstars, Fire magic, buffs, summons, and target-specific control	Buying more low-damage bodies without checking whether they can penetrate.
High Defence, ethereal, or Glamour targets	Area effects, attack support, magic weapons, Astral tools, and imported counters	Treating a second expensive infantry block as guaranteed contact.
Fire-resistant armies	Mundane weapon selection, Earth support, Astral-Blood options, summons, or imported damage	Building the entire battle around heat and Fire because they are national strengths.
Cold and fatigue pressure	Resistance, shorter fights, formation depth, spell disruption, and reserves	Assuming native heat prevents cold damage or exhaustion automatically.
Armour-negating and MR attacks	Spacing, resistance, summons, counter-caster pressure, and target-specific buffs	Treating Protection 17 as a defence against every damage channel.
Fast flankers and flyers	Protected mages, guards, reserves, wider lines, and local commanders	Leaving the capital mage portfolio in one exposed rear cluster.
Raids and dispersed pressure	Warlords, Slayers, forts, scouts, patrols, and prepared local forces	Expecting slow infantry to recover every province after contact.
Underwater objectives	Independent or summoned amphibious access, a Pretender bridge, and a separate logistics plan	Assuming Fire resistance or wasteland survival supplies underwater capability.
Pressure on the Blood economy	Distributed hunting, patrols, protected laboratories, reserve casters, and alternative research	Concentrating slaves, hunters, researchers, and high-path mages in one vulnerable province.

Monthly Abysia audit

- Is the current troop queue limited by gold, resources, recruitment points, leadership, or travel time?
- Does each infantry version have a target-specific reason to be in the queue?
- Are Humanbred being used for their actual cost and movement profile, without treating them as disposable Abysians?
- Does every Salamander group have suitable leadership and a target vulnerable to heat or Fire?
- Is the capital commander queue buying the exact Astral, Blood, mobility, or priest capability required next?
- Are Warlock and Dragon randoms labelled by their displayed final paths?
- Does the research target have a legal, protected caster already recruited?
- Are Fire gems, Earth gems, and blood slaves budgeted separately?

- Are hunting unrest, patrol strength, population, and slave transport recorded instead of assumed?
- Is a cave fort valuable for its position as well as its unquantified national bonus?
- Are sacred recruitment and the bless large enough to justify one another?
- Can the research and Blood infrastructure survive a raid, siege, or assassination campaign?

Abysia unresolved evidence boundary

The following claims remain open:

- 1 exact expansion-party ranges for Humanbred, each infantry weapon profile, Salamanders, and Lava Warriors;
- 2 live 6.36 confirmation of the Warlock's pinned 10% second random and any Dragon random, which the manual does not display;
- 3 the numerical cave-fort gold and resource bonus;
- 4 the exact post-6.01 wall-defender count and composition;
- 5 Inner Furnace's current affected-unit boundary, heat-area increase, stacking, and formation-level fatigue results;
- 6 Infernal Breeding's current output distribution, afflictions, ages, and economic return;
- 7 displayed O'al Kan's Sceptre cost after national rebate, other forge modifiers, artifact availability, and rounding;
- 8 assassination, blood-hunting, Blood Searcher, and patrol outcomes in a particular game state;
- 9 underwater access, battlefield scripts, and Pretender designs in a specific map and opponent field;
- 10 modded Abysia variants, which remain separate from this unmodded chapter.

These questions remain evidence gaps; no rule or new test asset fills them. R-047, R-058, and the wider hands-on runtime queue stay parked until testing is explicitly resumed.

Dossier source register

Official

- Dominions 6 Manual, revision 2: MA Abysia nation pages; national spells and rituals; Blood and crossbreeding; forging; and fort construction.
- Illwinter official patch history through 6.36, including the 6.01 Abysia wall-defender note. No numerical defender change was inferred where the announcement supplied none.

Structured snapshot

- Dominions 6 Data Inspector, commit cfac4311bc0b58053b8dead7bfffbc036ba9bd5dc, pinned to the 6.35 data update; used for mage random masks, recruitment records, capital sites, national spell restrictions, national item fields, and current object cross-checks.

Interpretation boundary

Roster entries, path masks, costs, site income, item restrictions, and national ritual requirements are source facts. Openings, research trees, Pretender families, battlefield packages, and matchup advice are strategy. Expansion counts, live random displays, cave-fort arithmetic, wall-defender composition, crossbreeding outputs, displayed forge-cost stacking, spell behaviour, and combat outcomes remain observation questions until a versioned raw set is published.
